

Full Stack Engineer Test Task

Build a small MVP for an online lottery platform using Next.js, NestJS, and Supabase in an AI-driven development environment.

The application should allow users to sign up, view available lottery draws, purchase tickets, and see their purchased tickets. An admin should be able to create lottery draws, close a draw, and generate a random winning number.

A draw should contain a title, description, ticket price, draw date, and status (Draft, Open, Closed, Finished). Every purchased ticket must receive a unique ticket number within the draw.

Requirements

- Use Supabase Auth for authentication.
- Create a REST API with NestJS.
- Store data in Supabase PostgreSQL.
- Build a simple UI with Next.js and Tailwind CSS.
- The development environment and workflow should be AI-driven (use AI tools during development and be ready to explain how they were used).

Users should be able to:

- View available draws
- Purchase tickets
- View their tickets
- View winning numbers for completed draws

Admin should be able to:

- Create draws
- Close draws
- Generate a random winning number for a draw

Please deploy the application and provide:

- A link to the deployed application
- A link to the GitHub repository
